Summer Internship 2021

Jeevitiv India Pvt.Ltd.

Jeevitiv is an EHR (Electronic health record) organization. EHR provides features such as facility to book their appointments with associated Doctors, easing the gap between a Doctor and Patient. With an equal facility for the doctors to easily manage their patients.

Category : Hospital & Health Care

CEO : Mr Raman Rachit

Establishment Year : 2020

JEEVITIV

Your Health Matters

Objective

The project comprises of an online pharmacy and healthcare web application to devise a useful platform called "Homeds" which enables users to order pharmaceutical and healthcare products online at the comfort of their home by making their purchase easy, simple, and affordable.

Features

Homeds provides the following features for smooth user experience :-

- User SignIn /Sign Up
- Choose products from six different categories
- Deals of the Day
- Checkout Page

Technology Stack

List of technologies used to create the platform

- HTML
- CSS
- JAVASCRIPT
- REACT JS
- REACT CONTEXT API
- FIREBASE

HTML

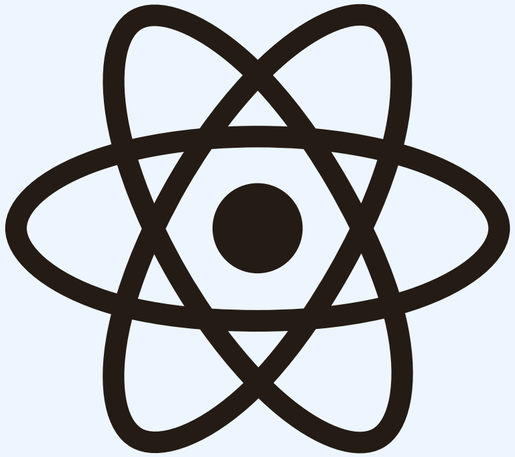
HTML (HyperText Markup Language) is the most basic building block of the Web. It defines the structure of web content and is the backbone of a webpage.

CSS

Used for beautifying the page by adding properties that change the appearance of the output. CSS (Cascading Style Sheets) is used to style and layout web pages — for example, to alter the font, color, size, and spacing of your content, split it into multiple columns, or add animations and other decorative features.

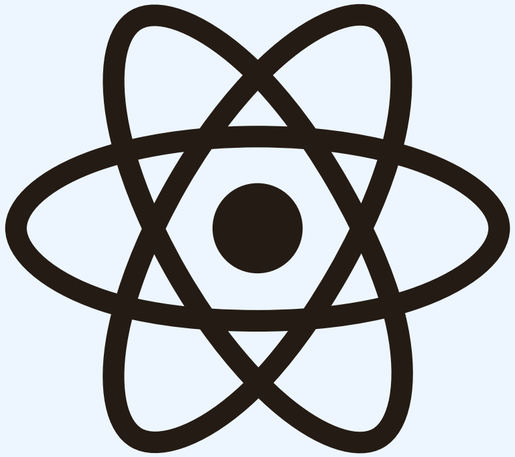
Javascript

Used for adding functionality to your webpage. It can be added transitions or button triggers or server connections.



React Js

Used for front-end creation with Java Script. It helps in the creation of reusable components.It was initially developed and maintained by Facebook and later used in its products like WhatsApp & Instagram.



React Context Api

In a typical React application, data is passed top-down (parent to child) via props, but such usage can be cumbersome for certain types of props (e.g. locale preference, UI theme) that are required by many components within an application. Context provides a way to share values like these between components without having to explicitly pass a prop through every level of the tree.

Firebase

Firebase is a platform developed by Google for creating mobile and web applications. Firebase is used for managing user authentication and their credentials.
